

VIT

Vellore Institute of Technology

Final Assessment Test - June 2023

Course: BMAT102L - Differential Equations and Transforms

Class NBR(s): 0377 / 0398 / 4426 / 4459 / 4500 / 4502 /

4587 / 4589 / 4591 / 4660 / 4662 / 4664 / 4868 / 4870 /

4872 / 4874 / 4876 / 4878 / 4898 / 4900 / 4902 / 4904 /

4906 / 04908

Slot: A1+TA1+TAA1

Max. Marks: 100

Time: Three Hours

KEEPING MOBILE PHONE/SMART WATCH, EVEN IN 'OFF' POSITION IS TREATED AS EXAM MALPRACTICE

Answer any TEN Questions  
(10 X 10 = 100 Marks)

- The radial displacement  $u$  in a rotating disc at a distance  $r$  from the axis is given by the linear differential equation with variable coefficients

$$u = r \frac{d}{dr} \left( r \left( \frac{du}{dr} \right) \right) + ar^3, \text{ where 'a' is a constant. Solve the equation.}$$

- A condenser of capacity  $C$  discharged through an inductance and resistance  $R$  in series and the charge  $q$  at time  $t$  satisfies the equation  $L \frac{d^2q}{dt^2} + R \frac{dq}{dt} + \frac{q}{C} = E$ .

Given that  $L = 0.25$  Henries,  $R = 12.5$  Ohms,  $C = 10^{-2}$  Farads,  $E = 3 \sin 2t$ , and that when  $t = 0$ , charge in the capacitor and current in the circuit are zero. Find the charge  $q$  in terms of  $t$  by using method of variation of parameters.

- Form the partial differential equation by eliminating the arbitrary functions from  $z = \frac{1}{x} [f(x-ay) + g(x+ay)]$ .
  - Obtain the complete solution of the partial differential equation

$$p(1+q^2) = q(x-a).$$

Solve the partial differential equation

$$(x^2 + 3xy^2)p + (y^3 + 3x^2y)q = (x+y)^2z.$$

Find the Laplace transform of  $f(t) = \begin{cases} 2t & 0 < t < 2 \\ 8-2t & 2 < t < 4 \end{cases}$  where  $f(t) = f(t+4)$

and also draw the function  $f(t)$ .

Find the inverse Laplace transform of the function  $Y(s) = \frac{s(s^2-a^2)}{s^4+4a^4}$ .

Solve  $\frac{\partial u}{\partial x} + x \frac{\partial u}{\partial t} = 2x$  where  $x > 0, t > 0, u(x, 0) = 1, u(0, t) = 1$  by using Laplace Transforms.

- Obtain the Fourier series for the function  $f(x) = 2x - x^2$  in  $(0, 3)$  and deduce that the value of  $\frac{1}{1^2} - \frac{1}{2^2} + \frac{1}{3^2} - \frac{1}{4^2} + \dots$ .

- Obtain the Fourier series for  $f(x) = |x|$  in  $-\pi < x < \pi$  and also by using Parseval's identity formula, evaluate  $1 + \frac{1}{2^4} + \frac{1}{3^4} + \frac{1}{4^4} + \dots$ .

- Find the Fourier cosine transform of  $f(x) = \frac{1}{x^2+25}$  and hence derive Fourier sine transform of  $f(x) = \frac{x}{x^2+25}$ .

11. If  $U(z) = \frac{2z^2+3z+12}{(z-1)^4}$  then find the value of  $u_2$  and  $u_3$ .

- Solve the difference equation  $y_{n+2} - 5y_{n+1} + 6y_n = 36$  given that  $y_0 = y_1 = 0$  using Z-Transforms.
