

SCHOOL OF COMPUTER SCIENCE AND ENGINEERING  
CONTINUOUS ASSESSMENT TEST - II  
FALL SEMESTER 2024-2025

**Programme Name & Branch** : **B.Tech (CSE & Specializations)**  
**Course Code and Course Name** : **BCSE308L & Computer Networks**  
**Faculty Name(s)** : **Common for all**  
**Class Number(s)** : **Common for all**  
**Date of Examination** : **16.10.2024**  
**Exam Duration** : **90 minutes** **Maximum Marks: 50**

ANSWER KEY

Q. No	Question	M
1.	<p>a. Draw the sender and receiver windows for a system using Selective Repeat ARQ (3-bits for sequence number), given the following:</p> <p>i) Frame 0 is sent; frame 0 is acknowledged.            ii) Frame 1 and 2 are sent; frames 1 and 2 are acknowledged.            iii) Frame 3, 4 and 5 are sent; frame 4 is acknowledged; timer for frame 5 expires.            iv) Frame 5, 6 and 7 are sent; frames 4 through 7 are acknowledged.</p> <p>The diagram illustrates the state of sender and receiver windows and frame transmissions over time. The sender window (left) and receiver window (right) are shown as 3-bit sequences. Frame 0 is sent and acknowledged (ACK 1). Frames 1 and 2 are sent and acknowledged (ACK 3). Frames 3, 4, and 5 are sent; frame 4 is acknowledged (ACK 5), but frame 5's timer expires. Frames 5, 6, and 7 are then sent and acknowledged (ACK 0).</p>	7
	<p>i) Frame 0 is sent; frame 0 is acknowledged.            Sender Window: [0, 1, 2]            Receiver Window: [0, 1, 2]</p> <p>Frame 0 sent, acknowledged. Move the window.</p> <p>ii) Frame 1 and 2 are sent; frames 1 and 2 are acknowledged.            Sender Window: [3, 4, 5]            Receiver Window: [0, 1, 2]</p> <p>Frames 1 and 2 sent, acknowledged. Move the window.</p> <p>iii) Frame 3, 4, and 5 are sent; frame 4 is acknowledged; timer for frame 5 expires.            Sender Window: [5, 6, 7]            Receiver Window: [0, 1, 2]</p> <p>Frame 4 acknowledged, but frame 5 not acknowledged (timeout). Resend frame 5.</p> <p>iv) Frame 5, 6, and 7 are sent; frames 4 through 7 are acknowledged.</p>	

SCHOOL OF COMPUTER SCIENCE AND ENGINEERING  
CONTINUOUS ASSESSMENT TEST - II  
FALL SEMESTER 2024-2025

	<p>Sender Window: [0, 1, 2] Receiver Window: [0, 1, 2]</p> <p>Frames 5, 6, and 7 sent, frames 4 through 7 acknowledged. Move the window.</p> <p>b. There are <math>n</math> stations in a slotted LAN. Each station attempts to transmit with a probability <math>p</math> in each time slot. What is the probability that ONLY one station transmits in a given time slot?</p> <p>The probability of that chosen station transmitting is <math>p</math>, and the probability of the other <math>n - 1</math> stations not transmitting is <math>(1 - p)^{n-1}</math>.</p> <p>Since there are <math>n</math> ways to choose which station will transmit, the total probability <math>P</math> that exactly one station transmits in a given time slot is given by:</p> $P = n \cdot p \cdot (1 - p)^{n-1}$ <p>So, the probability that only one station transmits in a given time slot is:</p> $P = np(1 - p)^{n-1}$ <p>1. The probability that a specific station transmits in a time slot is <math>p</math>.</p> <p>2. The probability that a specific station does not transmit is <math>1 - p</math>.</p>	3
2.	<p>Assume an organization's network starting address is 10.10.0.0/16 and divided into equal no. of addresses for 16 blocks. Find the following:</p> <p>i. Class _____ and default Subnet mask for the class _____</p> <p>ii. No. of addresses in each subnet works _____</p> <p>iii. Subnet mask of each subnetwork _____</p> <p>iv. CIDR of each subnetwork _____</p> <p>v. Write Starting address and end address of each subnetwork.</p> <p>vi. How many bits borrowed for subnetwork from host bits?</p> <p><b>i. Class and Default Subnet Mask</b></p> <ul style="list-style-type: none"> <li>• <b>Class:</b> A (since the first octet is 10, which is in the range of 1 to 126)</li> <li>• <b>Default Subnet Mask for Class A:</b> 255.0.0.0 or /8</li> </ul> <p><b>ii. Number of Addresses in Each Subnetwork</b></p> <p>To determine the number of addresses in each subnet, we first note that the original /16 network provides:</p> <ul style="list-style-type: none"> <li>• Total addresses: <math>2^{32-16} = 2^{16} = 65,536</math> addresses</li> </ul> <p>Dividing this into 16 equal blocks:</p> <ul style="list-style-type: none"> <li>• Addresses per subnet: <math>\frac{65,536}{16} = 4,096</math> addresses per subnet.</li> </ul> <p><b>iii. Subnet Mask of Each Subnetwork</b></p>	10

SCHOOL OF COMPUTER SCIENCE AND ENGINEERING  
CONTINUOUS ASSESSMENT TEST - II  
FALL SEMESTER 2024-2025

	<p>Since we are dividing the /16 network into 16 subnets, we need to determine how many bits are required to create these subnets. The formula for the number of subnets is <math>2^n</math>, where <math>n</math> is the number of bits borrowed.</p> <p>To get 16 subnets:</p> <ul style="list-style-type: none"> <li><math>2^n = 16 \Rightarrow n = 4</math></li> </ul> <p>Thus, we borrow 4 bits from the host part of the address.</p> <p>The new subnet mask will be:</p> <ul style="list-style-type: none"> <li>Original mask: /16</li> <li>New mask: /16 + 4 = /20</li> </ul> <p><b>iv. CIDR of Each Subnetwork</b></p> <p>The CIDR (Classless Inter-Domain Routing) notation for each subnetwork will be /20.</p> <p><b>v. Starting Address and End Address of Each Subnetwork</b></p> <p>With a /20 subnet mask, each subnet has 4,096 addresses. The starting addresses of each subnet can be calculated as follows:</p> <ol style="list-style-type: none"> <li><b>Subnet 1:</b> 10.10.0.0 – 10.10.15.255</li> <li><b>Subnet 2:</b> 10.10.16.0 – 10.10.31.255</li> <li><b>Subnet 3:</b> 10.10.32.0 – 10.10.47.255</li> <li><b>Subnet 4:</b> 10.10.48.0 – 10.10.63.255</li> <li><b>Subnet 5:</b> 10.10.64.0 – 10.10.79.255</li> <li><b>Subnet 6:</b> 10.10.80.0 – 10.10.95.255</li> <li><b>Subnet 7:</b> 10.10.96.0 – 10.10.111.255</li> <li><b>Subnet 8:</b> 10.10.112.0 – 10.10.127.255</li> <li><b>Subnet 9:</b> 10.10.128.0 – 10.10.143.255</li> <li><b>Subnet 10:</b> 10.10.144.0 – 10.10.159.255</li> <li><b>Subnet 11:</b> 10.10.160.0 – 10.10.175.255</li> <li><b>Subnet 12:</b> 10.10.176.0 – 10.10.191.255</li> <li><b>Subnet 13:</b> 10.10.192.0 – 10.10.207.255</li> <li><b>Subnet 14:</b> 10.10.208.0 – 10.10.223.255</li> <li><b>Subnet 15:</b> 10.10.224.0 – 10.10.239.255</li> <li><b>Subnet 16:</b> 10.10.240.0 – 10.10.255.255</li> </ol> <p><b>vi. How Many Bits Borrowed for Subnetwork from Host Bits</b></p> <p>We borrowed <b>4 bits</b> from the host bits to create the 16 subnets.</p>	
3.	<p>a. An IP datagram has arrived with partial information the header 4500005400030000 2006.....</p> <ol style="list-style-type: none"> <li>What is the header size- <b>20 bytes</b></li> <li>Are there any options in the packet- <b>NO</b></li> <li>What is the size of data – <b>84-20=64 Bytes</b></li> <li>Is the packet fragmented -<b>NO</b></li> <li>How many more routers can the packet travel to? <b>32 Routers</b></li> <li>What is the protocol number of the payload being carried by the packet? <b>06-TCP</b></li> </ol>	8

SCHOOL OF COMPUTER SCIENCE AND ENGINEERING  
CONTINUOUS ASSESSMENT TEST - II  
FALL SEMESTER 2024-2025

	<p>b. Identify the status of flags in IP header format for different scenarios listed below:</p> <p>i) Datagram size=200 bytes and MTU= 400 bytes U-0 D-1 M-0</p> <p>ii) Datagram size=1500 bytes and MTU= 400 bytes U-0 D-0 M-1</p>	2
4.	<p>a. Routers 1 to 5 are connected as shown below. Exhibit the count to infinity problem if node A fails. Assume the distance between the routers are 1. What is the solution to this problem?</p>  	5
	<p>b. For the network on the right, give distance vector tables when, each node knows only the distances to its neighbours.</p>	5

5. Explore the below mentioned formulate the routing table using the below given equation, where each router shares its knowledge of its neighbours with every other router in the internetwork. 10

**SCHOOL OF COMPUTER SCIENCE AND ENGINEERING**  
**CONTINUOUS ASSESSMENT TEST - II**  
**FALL SEMESTER 2024-2025**

$D(v) = \min(D(v), D(w) + c(w,v))$   
 w- source node; v- destination node  
 $c(w,v)$ -link cost from node w to v  
 $D(v)$ -current value of cost from source to destination

Step	N'	D(v),p(v)	D(w),p(w)	D(x),p(x)	D(y),p(y)	D(z),p(z)
0	u	2,u	5,u	1,u	$\infty$	$\infty$
1	ux	2,u	4,x		2,x	$\infty$
2	uxy	2,u	3,y			4,y
3	uxyv		3,y			4,y
4	uxyvw					4,y
5	uxyvwz					

resulting shortest-path tree from u:

resulting forwarding table in u:

destination	link
v	(u,v)
x	(u,x)
y	(u,x)
w	(u,x)
z	(u,x)
