

**VIT**Vellore Institute of Technology
Approved by the University under section 3 of UGC Act, 1956**SCHOOL OF CHEMICAL ENGINEERING**
CONTINUOUS ASSESSMENT TEST -II
FALL SEMESTER 2025-2026

REG. NO.:

SLOT: D1+TD1

Programme Name & Branch : B. Tech (Chemical Engineering)
Course Code : BCHE201L
Course Name : Computational Methods in Chemical Engineering
Faculty Name(s) : Prof. Monash P. /Dr. Anand VP Gurumoorthy
Faculty Emp ID : 14831/13332
Class Number(s) : VL2025260101219/VL2025260101223
Date of Examination : 08-10-2025 Time: 2:00 PM - 3:30 PM
Exam Duration : 90 minutes Maximum Marks: 50

General instruction(s):

Assume data wherever necessary

Use four decimal places of accuracy, unless otherwise stated.

Course Outcomes:

CO3: Select suitable numerical regression and interpolation techniques for data analysis.

CO4: Compute numerical integration and optimization.

CO5: Determine the numerical solution for ordinary and partial differential equations.

Q. No	Question	Marks	CO	BL																
✓ 1.	The rheological properties of a particular suspension can be approximated using a power law model and represented by the following equation. $\tau_w = k\dot{\gamma}^n$ where, τ_w is shear stress at wall in N/m^2, $\dot{\gamma}$ is the shear strain rate in s^{-1}, k is the consistency coefficient and n is the flow behavior index. Experimental data of shear stress vs. shear strain rate is given in the following table. <table><tr><td>Shear Strain Rate, $\dot{\gamma}$, s^{-1}</td><td>1</td><td>5</td><td>10</td><td>15</td><td>20</td><td>25</td></tr><tr><td>Shear Stress, τ_w, N/m^2</td><td>0.5</td><td>4</td><td>11</td><td>20</td><td>31</td><td>44</td></tr></table> Apply suitable regression method to determine the consistency coefficient and the flow behavior index. Identify the given non-newtonian fluid and determine the shear stress when shear strain rate of $23 s^{-1}$.	Shear Strain Rate, $\dot{\gamma}$, s^{-1}	1	5	10	15	20	25	Shear Stress, τ_w , N/m^2	0.5	4	11	20	31	44	10	3	3		
Shear Strain Rate, $\dot{\gamma}$, s^{-1}	1	5	10	15	20	25														
Shear Stress, τ_w , N/m^2	0.5	4	11	20	31	44														
✓ 2.	Velocity of a free-falling parachutist with respect to time is given in the following Table. <table><tr><td>t, (seconds)</td><td>0</td><td>1.5</td><td>3</td><td>4.5</td><td>6</td><td>7.5</td><td>9</td></tr><tr><td>v, (m/s)</td><td>0</td><td>12.8</td><td>22.6</td><td>30.1</td><td>35.6</td><td>39.9</td><td>43.2</td></tr></table> Compute the distance of fall of the parachutist between the time 0 and 9 seconds using multiple application trapezoidal method and Simpson's method.	t, (seconds)	0	1.5	3	4.5	6	7.5	9	v, (m/s)	0	12.8	22.6	30.1	35.6	39.9	43.2	10	4	3
t, (seconds)	0	1.5	3	4.5	6	7.5	9													
v, (m/s)	0	12.8	22.6	30.1	35.6	39.9	43.2													

Q. No	Question	Marks	CO	BL																			
3.	The simple resistor circuit contains three fixed resistors and one adjustable resistor as shown in the figure. The values for the parameters are $V = 90 \text{ V}$, $R_1 = 9 \Omega$, $R_2 = 6 \Omega$, and $R_3 = 4 \Omega$. The expression for power for the circuit can be derived from Kirchhoff's laws.  $P(R_a) = \frac{\left[\frac{VR_3R_a}{R_1(R_a + R_2 + R_3) + R_3R_a + R_3R_2} \right]^2}{R_a}$ Apply suitable 1-D unconstrained optimization method that maximizes the power transfer across the terminals 1 and 2 by changing the value of the adjustable resistance R_a over the range from 0Ω to 10Ω. Solve for the specified error, $\epsilon_s = 5$.	10	4	3																			
4.	A small refinery receives up to 120 m^3 of crude feed per week and has 100 production hours available per week. On-site total storage capacity is unlimited. Profit per tonne and resource usage per tonne of products are given below. <table><tr><th rowspan="2">Resource</th><th colspan="3">Product</th></tr><tr><th>Regular Unleaded (R)</th><th>Premium Unleaded (P)</th><th>Ethanol-Blended (E)</th></tr><tr><td>Crude feed (m^3/tonne)</td><td>9</td><td>8</td><td>7</td></tr><tr><td>Production time (h/tonne)</td><td>6</td><td>8</td><td>4</td></tr><tr><td>Profit (\$/tonne)</td><td>200</td><td>220</td><td>180</td></tr></table> Develop linear programming to maximize the profit using SIMPLEX method.	Resource	Product			Regular Unleaded (R)	Premium Unleaded (P)	Ethanol-Blended (E)	Crude feed (m^3/tonne)	9	8	7	Production time (h/tonne)	6	8	4	Profit (\$/tonne)	200	220	180	10	4	3
Resource	Product																						
	Regular Unleaded (R)	Premium Unleaded (P)	Ethanol-Blended (E)																				
Crude feed (m^3/tonne)	9	8	7																				
Production time (h/tonne)	6	8	4																				
Profit (\$/tonne)	200	220	180																				
5.	Formulate a model (differential equation) of a falling parachutist using Newton's second law. The two forces acting on the parachutist are the downward pull of gravity F_0 and the upward force F_D due to drag as a second-order rate resistance (i.e. $F_D = -cv^2$). The drag coefficient, c, is 0.225 kg/m and the mass of the parachutist is 68 kg. Apply Euler method to determine the time and velocity for 10 seconds. Initial Condition: At time $t = 0 \text{ s}$, velocity, $v = 0 \text{ m/s}$ (i.e. $v(0) = 0$). Take time step as 2 s ($\Delta t = 2$) and $g = 9.81 \text{ m/s}^2$.	10	5	3
