CONTINUOUS ASSESSMENT TEST - II  
WINTER SEMESTER 2025-2026

**Programme Name & Branch** : B.Tech.  
**Course Code and Course Name** : BCSE204L – Design and Analysis of Algorithms  
**Faculty Name(s)** : All Faculty  
**Class Number(s)** : All Batches  
**Date of Examination** : 22.03.2026  
**Exam Duration** : 90 minutes **Maximum Marks: 50**

**General instruction(s):**

- Answer All Questions
- M - Max mark; CO – Course Outcome; BL – Blooms Taxonomy Level (1 – Remember, 2 – Understand, 3 – Apply, 4 – Analyse, 5 – Evaluate, 6 – Create)
- Course Outcomes: (Type the CO statements covered in this question paper. Use the CO number as per the syllabus copy)

| Q. No       | Question  | M         | CO | BL |    |    |    |             |   |   |   |   |   |        |    |    |    |    |    |    |   |   |
|-------------|---|-----------|----|----|----|----|----|-------------|---|---|---|---|---|--------|----|----|----|----|----|----|---|---|
| 1.          | <p>a) A delivery company must select items to load into a transport container with a maximum capacity of <b>15 kg</b>. Each item can either be selected or rejected (a 0–1 decision). The items available are:</p> <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>Attribute</th> <th>I1</th> <th>I2</th> <th>I3</th> <th>I4</th> <th>I5</th> </tr> </thead> <tbody> <tr> <td>Weight (kg)</td> <td>2</td> <td>5</td> <td>6</td> <td>4</td> <td>3</td> </tr> <tr> <td>Profit</td> <td>20</td> <td>30</td> <td>35</td> <td>25</td> <td>15</td> </tr> </tbody> </table> <p>Apply the <i>FIFO (First-In-First-Out) Branch and Bound</i> strategy to solve the above problem. <b>Illustrate</b> the state-space tree until optimal solution is determined. For every generated node, clearly compute and show the <i>current weight (W)</i>, <i>current profit (V)</i>, <i>upper bound (UB)</i> using the fractional knapsack bound, and the <i>current global best profit (GB)</i>. Clearly <i>identify the nodes that are pruned with justification</i> and mark the <i>optimal set of items and the maximum achievable profit</i>. [ 7 M]</p> <p>b) Finally, <i>differentiate between Backtracking and Branch &amp; Bound algorithms</i> by presenting <i>any three key differences in tabular form</i>. [3 M]</p> | Attribute | I1 | I2 | I3 | I4 | I5 | Weight (kg) | 2 | 5 | 6 | 4 | 3 | Profit | 20 | 30 | 35 | 25 | 15 | 10 | 2 | 3 |
| Attribute   | I1  | I2        | I3 | I4 | I5 |    |    |             |   |   |   |   |   |        |    |    |    |    |    |    |   |   |
| Weight (kg) | 2   | 5         | 6  | 4  | 3  |    |    |             |   |   |   |   |   |        |    |    |    |    |    |    |   |   |
| Profit      | 20  | 30        | 35 | 25 | 15 |    |    |             |   |   |   |   |   |        |    |    |    |    |    |    |   |   |
| 2.          | <p>Consider the text <math>T = ABABACABACAB</math> and the target pattern <math>P = ABAC</math>. Solve for the LPS (Longest Prefix Suffix) array for the pattern <math>P</math>. Next, <b>execute</b> the Knuth–Morris–Pratt (KMP) algorithm on text <math>T</math> using your computed LPS array to identify all occurrences</p>   | 10        | 3  | 3  |    |    |    |             |   |   |   |   |   |        |    |    |    |    |    |    |   |   |

CONTINUOUS ASSESSMENT TEST - II  
WINTER SEMESTER 2025-2026

|    |   |   |   |   |
|----|---|---|---|---|
|    | <p>of the pattern. <b>Illustrate</b> your step-by-step trace by clearly indicating the text and pattern indices being compared, the specific shift <b>performed</b> after each mismatch, and the action taken after a successful match.</p> <p>Then estimate the total number of character comparisons that would be required <i>as per Naïve string-matching algorithm</i>. Finally, <b>demonstrate</b> how your KMP trace actively avoids the redundant comparisons inherent in the Naïve approach, and explicitly state the starting indices of all pattern occurrences found in the text.</p>   |   |   |   |
| 3. | <p>a) Consider the following weighted directed graph with vertices. Using the <b>Bellman–Ford algorithm</b>, compute the shortest path distances from source vertex <b>A</b> to all other vertices after <b>each relaxation iteration</b>. Show the distance values after every iteration. After completing the algorithm, <b>identify the shortest path from A to D</b> and its total cost. <b>[6 Marks]</b></p> <div data-bbox="363 1227 1086 1621" data-label="Diagram"> <pre> graph LR     A((A)) -- 4 --&gt; B((B))     A((A)) -- 7 --&gt; C((C))     B((B)) -- 5 --&gt; D((D))     C((C)) -- 2 --&gt; D((D))     B((B)) -- -2 --&gt; C((C))   </pre> </div> | 5 | 3 | 2 |
|    | <p>b) Briefly explain <b>why Bellman–Ford is suitable for this graph instead of Dijkstra’s algorithm</b>. Explain how the order in which edges are processed in the Bellman–Ford algorithm can influence the speed of convergence. Briefly illustrate your explanation using the given graph for two iterations. <b>[4 Marks]</b></p>   | 5 |   |   |

CONTINUOUS ASSESSMENT TEST - II  
WINTER SEMESTER 2025-2026

4. a) A data centre network routes data packets from a source server  $s$  to a destination server  $t$  through intermediate routers. Each directed link has a maximum transmission capacity (in units per second).

Apply the **Edmonds–Karp algorithm** to determine the **first three augmenting paths** using following conditions:

- i) In the first and second step, the route with the **highest residual capacity** should be prioritized.
- ii) In the third step, the route with the **shortest augmenting path** (smallest number of intermediate nodes) should be chosen for transportation.

In your answer, clearly present the following: the **original flow network** with all edge capacities indicated; the **augmenting path selected in the first iteration** (write the path as a sequence of vertices and do not mark it on the graph); the **flow network after the first augmentation** and the **corresponding residual graph**. Repeat the same process for the **second** and **third iterations**, showing in each case the selected augmenting path, the updated flow network after augmentation, and the corresponding residual graph. [ 9 M]

b) Explain how the Edmonds–Karp algorithm improves upon the Ford–Fulkerson method for solving the maximum flow problem. [1 M]

CONTINUOUS ASSESSMENT TEST - II  
WINTER SEMESTER 2025-2026

|                             |  |                             |                             |        |        |                             |                             |                             |                             |    |   |   |
|-----------------------------|--|-----------------------------|-----------------------------|--------|--------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|----|---|---|
| 5.                          | <p>A geographic monitoring system models underground cable routes as <b>line segments on a 2D plane</b>. The system records four cable segments with the following endpoints:</p> <table border="1" data-bbox="263 548 1284 705"> <tr> <td><math>L_1:</math></td> <td><math>L_2:</math></td> <td><math>L_3:</math></td> <td><math>L_4:</math></td> </tr> <tr> <td><math>(1,4) \rightarrow (6,1)</math>,</td> <td><math>(2,1) \rightarrow (5,5)</math>,</td> <td><math>(3,4) \rightarrow (7,3)</math>,</td> <td><math>(4,0) \rightarrow (4,6)</math>.</td> </tr> </table> <p>a) Compute the <b>orientation values for the necessary ordered triplet's</b> for the pair of line segments given below and determine whether the following pairs of <b>line segments</b> intersect. Show all intermediate calculations: [3 M]<br/> i) <math>L_1</math> and <math>L_2</math> ii) <math>L_1</math> and <math>L_3</math> iii) <math>L_2</math> and <math>L_4</math></p> <p>b) If a pair of segments intersects, compute the intersection point(s) using the equations of the corresponding lines. [3 M]</p> <p>c) Finally, briefly explain how the orientation method efficiently detects intersections among multiple line segments and compare it with a naïve approach that checks every pair of segments. [4 M]</p> | $L_1:$                      | $L_2:$                      | $L_3:$ | $L_4:$ | $(1,4) \rightarrow (6,1)$ , | $(2,1) \rightarrow (5,5)$ , | $(3,4) \rightarrow (7,3)$ , | $(4,0) \rightarrow (4,6)$ . | 10 | 3 | 3 |
| $L_1:$                      | $L_2:$   | $L_3:$                      | $L_4:$                      |        |        |                             |                             |                             |                             |    |   |   |
| $(1,4) \rightarrow (6,1)$ , | $(2,1) \rightarrow (5,5)$ ,  | $(3,4) \rightarrow (7,3)$ , | $(4,0) \rightarrow (4,6)$ . |        |        |                             |                             |                             |                             |    |   |   |
